Combined Storage of Lakes Buchanan and Travis

Comparison of 2019-2023 and 2008-2015

As of June 1, 2023

The combined storage data for 2023 is provisional and subject to change.

Effective May 27, 2021, storage values are based on the Texas Water Development Board volumetric survey of Lake Buchanan published in 2020 and the Lake Travis survey published in 2021.

The June 1 combined storage is 14,167 acre-feet greater in 2023 than in 2012.
Combined Lakes Projection

Lakes Buchanan and Travis combined conservation storage is managed to a maximum of 1.95 million acre-feet from May to October and 2 million acre-feet from November to April due to seasonal lake level limits for Lake Buchanan.
Average for June: 669.60 feet msl

Historic low (1951): 614.18 feet msl

*Based on results from the draft stochastic model under development to reflect provisions of the 2020 Water Management Plan*
Average for June: 1,013.65 feet msl

Historic low (1952): 983.70 feet msl

*Based on results from the draft stochastic model under development to reflect provisions of the 2020 Water Management Plan.
Lake Level Comparisons

For purposes of the 2020 Water Management Plan, the combined storage is defined as the total of the daily average volume of water in lakes Buchanan and Travis. This determination excludes any water in Lake Buchanan above elevation 1,018 feet msl in the months of May through October or above 1,020 feet msl in the months of November through April and any water in Lake Travis above elevation 681 feet msl.
